

Superset × Capgemini Buildathon 2026

SQL Case Investigation

Duration: 45 Minutes | **Mode:** Team-Based

This round evaluates your team's ability to think analytically, write structured SQL queries, and follow an evidence trail to identify the correct answer under time constraints.

SQL Case Investigation is a mystery-driven data challenge in which your team will analyse a fictional scenario and solve a case using the data available in an internal database. You will write SQL queries to retrieve evidence, interpret results, and arrive at a conclusion before time runs out.

Getting Started with SQL Case Investigation

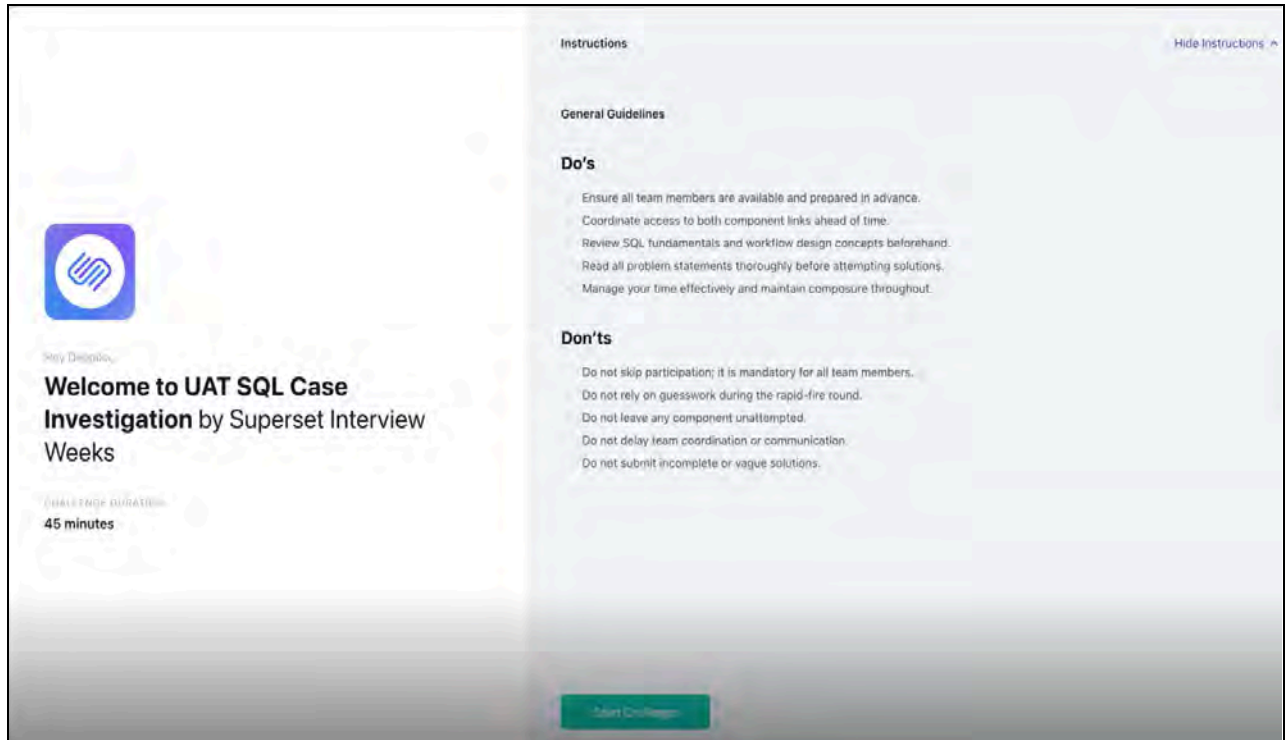

After successfully registering and forming your team, you will participate in the SQL Case Investigation challenge. This section provides a walkthrough of the platform and the challenge process.

Initial Guidelines and Setup

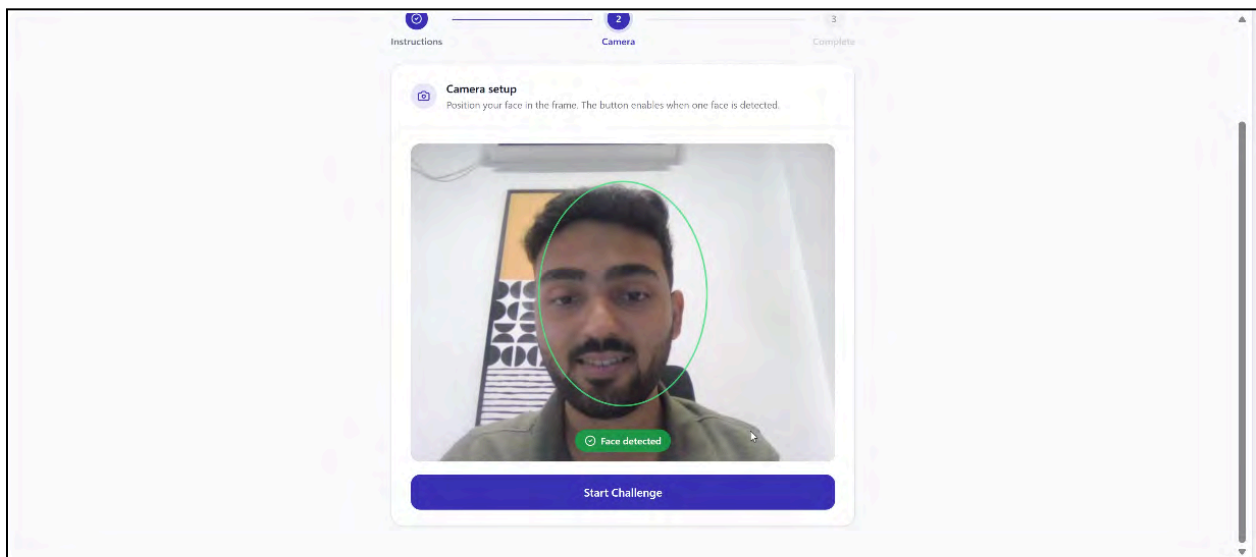

Upon entering the SQL Case Investigation platform, you will be presented with a set of General Guidelines. The challenge duration is 45 minutes.

Note: The challenge can only be started by the Team Captain. All team members must be present before the session begins.

- It is mandatory to ensure all team members are available and prepared in advance.
- You must coordinate access, review SQL fundamentals, and read all problem statements thoroughly.
- Do not skip participation, rely on guesswork, or submit incomplete solutions.

System Check

- Before starting the challenge, a camera setup is required for identity verification.
- Position your face in the frame; the "Start Challenge" button will enable once a face is detected.

Understanding the Challenge

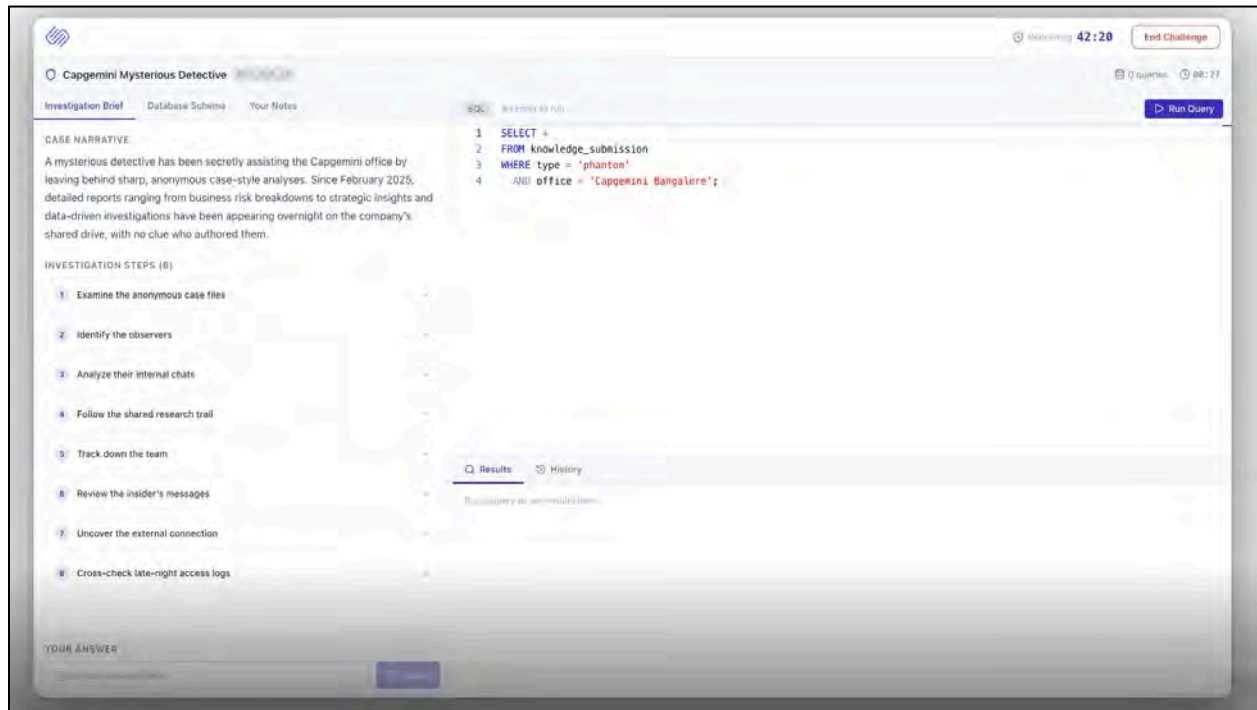

Once the challenge begins, you will be presented with the Case File. For example, a mystery scenario places you as a detective with access to all internal databases. You must write SQL queries to follow the evidence trail and identify the correct answer before time runs out.

- The case narrative introduces the scenario and the mystery you need to solve.
- You will be provided with investigation steps that guide the logical sequence in which the evidence should be followed.
- The interface also displays the data schema - all available tables and their relationships - which you can reference while writing your queries.

Interface Layout

When you open the Case File, the screen is divided into three key sections:

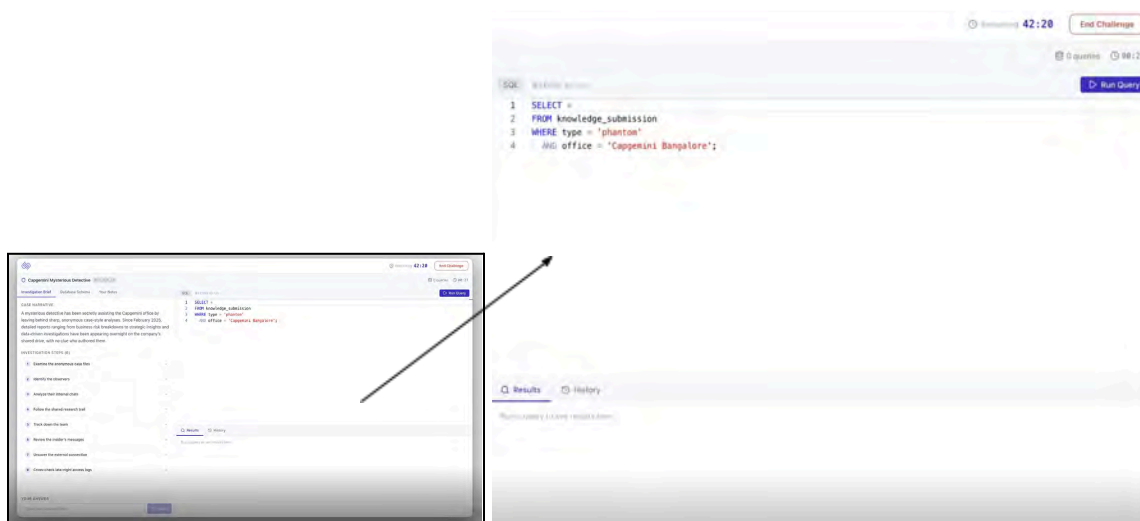

1. **Information Section** – Displays a brief description of the question along with the database schema.
2. **SQL Shell** – A command-line interface where SQL queries are executed.
3. **Result** – Displays the output of executed queries along with query history.

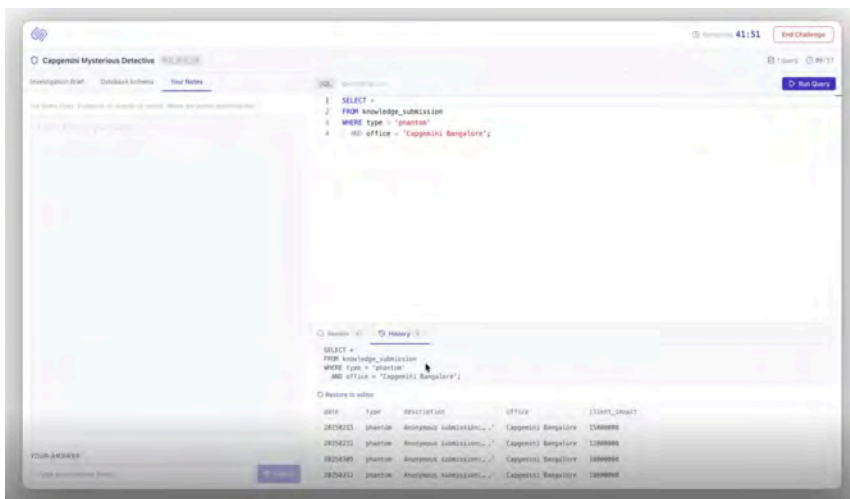

Writing SQL Queries

The core of the challenge involves using the SQL query editor embedded in the platform.

- You will write your SQL queries in the dedicated query input section.
- Click "Run Query" to execute your query — results will appear in the Results panel below.

- You can also view your query history to revisit previous attempts.
- A sample SQL query is provided on-screen for reference when you first open the Case File.

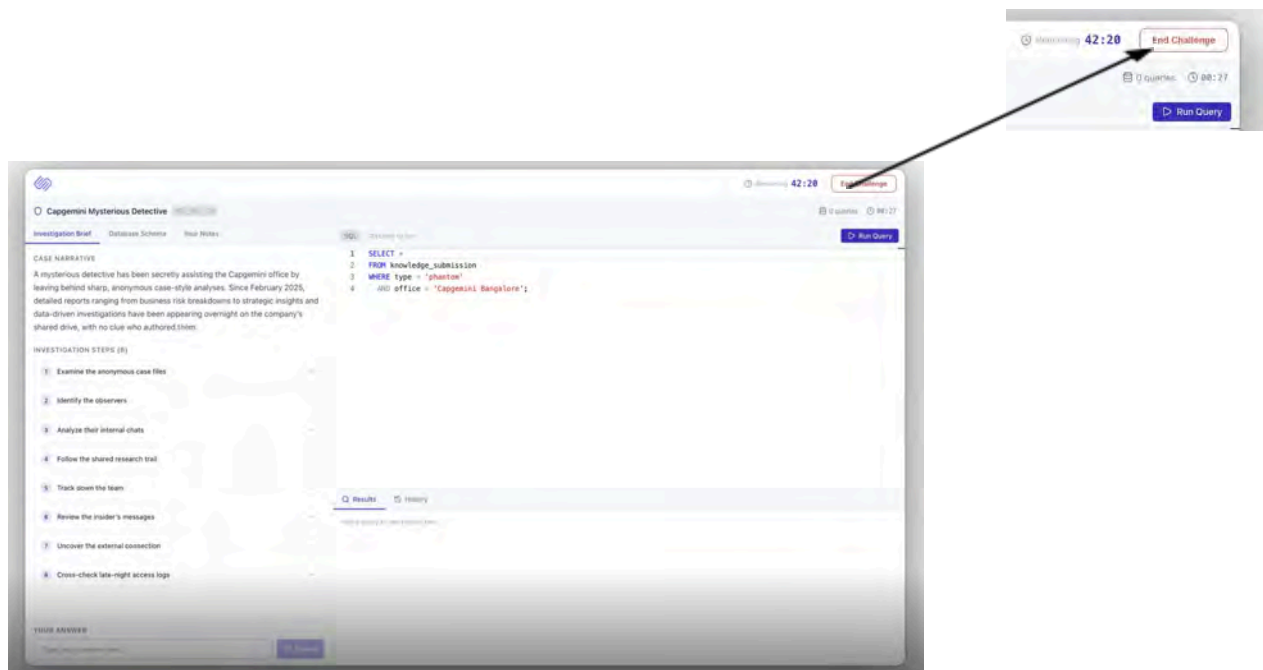

Tip: Use the Data Schema panel to understand the structure of each table before writing your queries. Cross-referencing multiple tables is often required to follow the full evidence trail.

Final Submission

Once you have derived the correct answer from your SQL queries, you must enter your answer in the designated answer field on the platform.

- Type your answer in the answer input box and click Submit.
- After submitting your primary answer, you will be presented with a Bonus Question related to the case — answer this as well for additional credit.
- When you are confident both answers are correct, click Submit Investigation to finalise your submission.
- To fully complete the challenge, click End Challenge — this immediately locks your submission and no further changes can be made.

Warning: Clicking End Challenge cannot be undone. Your answers will be submitted immediately and you will not be able to make any changes after this action.
